

When the Link (combining) switches are in the "on" position, all cameras will be attached to the MS-704's channel "A". When you turn the link switch off on a IF4W4 module, that camera will be talking and listening to the Engineering channel (Channel "D") so the technician can have a private conversation with that CCU on channel "D". When they finish their repairs, the shading technician switches the "link" switch back to combining that module with "A" and that CCU is now back in the Camera Party Line.
